Manure digester partnership serves multiple farms

EnTech Solutions, A Division of Faith Technologies, Middleton, Wisconsin

A large set of dairy manure digesters in the Town of Springfield in Dane County were switched from producing electricity to producing renewable natural gas (RNG). A large group of partners, each bringing their own expertise, worked together to make this change. The RNG is injected into a natural gas pipeline in Madison and sold as a low carbon fuel in the California market to provide clean-burning vehicle fuel.

EnTech Solutions, one of the partners, says, "Overall, the facility reduces emissions by more than 13,500 metric tons of carbon dioxide equivalent per year. This reduction is comparable to removing emissions of nearly 34 million miles driven by passenger vehicles.

Digester Facts

Manure from 4200 wet cows on 4 farms

3 million-gallon digesters

Phosphorus removal from digester liquid, then returned to farms

Digester solids sold to compost company

On-site biogas purification

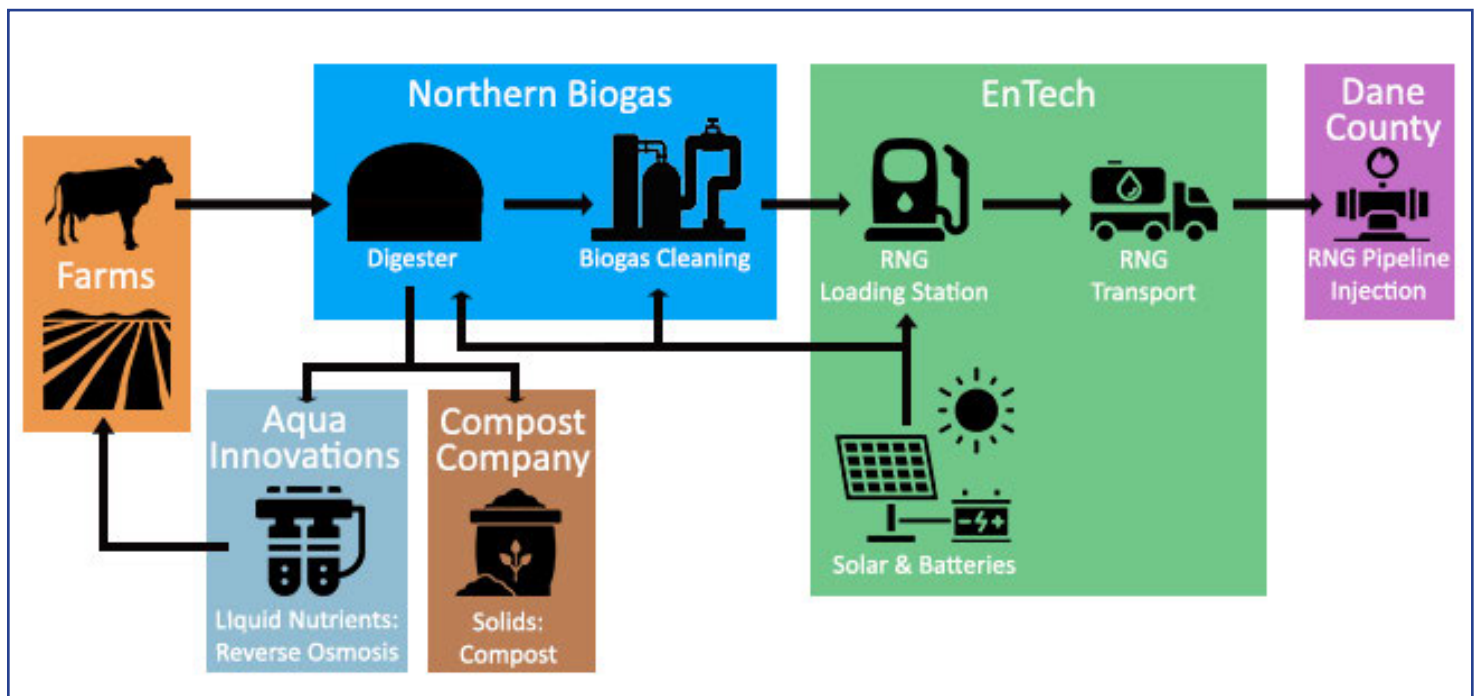

XX RNG produced daily

2.8 MW photovoltaic panels produce electricity for the facility and grid

Zeigler Dairy Farms across from EnTech transports manure via pipeline to the digester, Middleton, Wisconsin

RNG Production Process

EnTech Solutions RNG Production Process

1. Dairy farms supply manure

Scott Romenesko, President of EnTech Solutions, said, “Right now we’re getting manure from four farms... probably going to add two more by the time this is all done.” The current farms are providing manure from 4,200 milking cows. More than half of the manure comes from Zeigler Dairy Farms, located across the road from the digester. Manure from the other three dairy farms is trucked approximately 10 miles to the digesters. The farmers are paid per gallon of manure that they provide to the digester. They are not invested in the digester system.

2. Northern Biogas LLC operates digesters and biogas cleaning equipment

Northern operates and monitors the three one-million-gallon digesters that produce biogas. The digester liquids go to Step 3 for phosphorus removal and are then returned to the dairy farms. The digester solids are sold to Carbon Cycle, a compost company. Northern also operates and monitors the biogas cleaning equipment that removes contaminants from the RNG.

Liquid nutrient loading for delivery to farms

Digestate, digester solids, sold as compost

3. Aqua Innovations operates a reverse osmosis system to remove phosphorus from the digester liquids

Dane County supports phosphorus removal by Aqua Innovations to meet their goal of reducing phosphorus and algae in the Madison chain of lakes. Aqua Innovations uses a reverse osmosis system to concentrate nutrients from the digester liquids. In 2021, over 57,000 pounds of phosphorus were removed and transported outside the Yahara River watershed. One pound of phosphorus entering a lake or stream can result in up to 500 pounds of algae growth. The digester liquids with reduced phosphorus are trucked back to the dairy farms that provide manure. The concentrated phosphorus from the reverse osmosis system is sold to farmers in other watersheds.

4. EnTech Solutions operates microgrid with solar arrays, batteries, inverters, RNG loading station, and truck charging station

EnTech Solutions planned, installed and operates a microgrid with 2.8 megawatts (MW) of solar arrays that power the digester system. The largest onsite solar array consists of fixed, bifacial panels. EnTech also has nearly 500 kilowatt hours (kWh) in battery storage. In June 2022 Scott Romenesko said “Right now we’re producing way more electricity than the facility is using with the intention of electric trucks and maybe putting an electric dryer in the solid building and then drying up the [digester] solids. bringing it back to the farmers so they can use that for their bedding.”

Battery storage with solar arrays

In August 2022, EnTech Solutions announced that they plan to partner with Peterbilt Motors and Maki Trucking to use an electric truck to haul the compressed RNG about 20 miles to a pipeline injection port. This truck will be powered by EnTech’s solar arrays.

5. Dane County provides RNG injection port

Dane County provides an injection port on an interstate natural gas pipeline at their landfill. Without access to an injection port, other digesters may not have a way to sell RNG.

Future electric truck for transporting RNG to injection site

6. U.S. Gain purchases and markets RNG

U.S. Gain purchases the RNG and sells it on the California transportation market. California adopted a Low-Carbon Fuel Standard (LCFS) standard in 2007 to reduce their greenhouse gas emissions from transportation by 10% by 2020.

In the future these partners have plans for the future that include adding manure from another dairy farm or two, adding a fourth digester, and using energy produced onsite to dry the digestate into cow bedding.
